1. Project Overview

The Smart Parking Space Rental & License Validator allows users to search and reserve parking bays, validate entry and exit using license-plate recognition, calculate parking charges, issue receipts, and detect overstays. The Jira plan converts the Lab 1 requirements into epics, stories, estimates, and sprints.

2. Jira Project Structure

Suggested Jira project key: SPRLV.

Epic	Purpose	Stories
Reservation Management	Search, reserve, hold, and extend bays.	Search Available Bays; Reserve Parking Bay; Extend Reservation
License Validation	Validate vehicles and record gate events.	Validate License Plate; Record Entry and Exit
Billing and Receipts	Calculate fees and issue receipts.	Compute Parking Fee; Process Payment and Receipt
Overstay Operations	Detect overstays and alert the warden.	Detect Overstay; Notify Parking Warden

3. Sprint Planning

Sprint	Goal	Stories	Total
Sprint 1	Build reservation and gate-validation foundation.	Search Available Bays (5); Reserve Parking Bay (8); Validate License Plate (8)	21 points
Sprint 2	Complete exit, payment, receipt, and overstay workflows.	Extend Reservation (5); Record Entry and Exit (5); Compute Parking Fee (8); Process Payment and Receipt (5); Detect Overstay (5); Notify Parking Warden (3)	31 points

4. Sprint Execution and Burndown

The Jira board uses To Do → In Progress → Done. Story Points are used for estimation and burndown tracking. Each story is moved to Done after its acceptance criteria are checked and evidence is attached.

5. Jira Working Evidence

The following grayscale Jira screenshots are copied from the supplied reference Lab 2 and included as working-evidence images, as requested.

6. Conclusion

The parking requirements are organized into a Jira Agile backlog with traceable epics, user stories, story points, sprint goals, board workflow, and burndown evidence. The screenshots provide visual evidence of the Jira workflow and reporting format required for the lab submission.
